Introduction to Signals and Systems

Signals and systems are the foundational elements of electrical engineering and digital communications. They form the basis for analyzing real-world phenomena such as sound, images, temperature variations, and other physical quantities.

What Are Signals?

Signals are functions that convey information about the behavior or nature of a physical system. They can be classified into different types based on their characteristics:

- **Continuous-time signals:** Defined for every instant of time, e.g., analog audio signals.
- **Discrete-time signals:** Defined only at discrete time intervals, e.g., digital signals.
- **Periodic signals:** Repeating after a certain period, e.g., sine waves.
- **Aperiodic signals:** Non-repeating signals, e.g., transient signals.

Understanding Systems

Systems process signals to produce outputs based on inputs. They can be linear or nonlinear, time-invariant or time-varying, causal or non-causal.

- **Linear systems:** Satisfy superposition and homogeneity principles.
- **Time-invariant systems:** System properties do not change over time.
- **Causal systems:** Output depends only on present and past inputs.

Mathematical Transforms in Signal Processing

Transforms convert signals from one domain to another, often simplifying the analysis and design of systems. The most common transforms include Fourier, Laplace, and Z-transforms.

The Fourier Transform

The Fourier Transform is essential for analyzing the frequency content of signals.

- **Definition:** $X(f) = \int_{-\infty}^{\infty} x(t) e^{-j 2 \pi f t} dt$
- **Applications:** Spectrum analysis, filtering, and signal characterization.

The Laplace Transform

A powerful tool for analyzing linear time-invariant systems, especially for transient analysis.

- **Definition:** $L\{x(t)\} = X(s) = \int_0^{\infty} x(t) e^{-s t} dt$
- **Applications:** Control system stability, system response analysis.

The Z-Transform

Used primarily for discrete-time signals and systems.

- **Definition:** $Z\{x[n]\} = X(z) = \sum_{n=-\infty}^{\infty} x[n] z^{-n}$
- **Applications:** Digital filter design, system stability analysis.
